Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

NyAlternate names: colony-stimulating factor 2; GM-CSF
C;Species: Ovis orientalis aries, Ovis ammon aries (domestic sheep)
C;Accession: JH0469; S16730
C;Accession: JH0469; S16730
R;McInnes, C.J.; Haig, D.M.
Gene 105, 275-279, 1991
A;Title: Cloning and expression of a cDNA encoding ovine granulocyte-macrophage colony-s
A;Reference number: JH0469; MUID:92039044; PMID:1937025
A;Accession: JH0469; MUID:92039044; PMID:1937025

C;Comment: This protein is a glycoprotein cytchkine produced and secreted by various cell
C;Comment: This protein is a glycoprotein gravulating factor
C;Comment: This spratulocyte-macrophage colony-stimulating factor
C;Keywords: cytchkine; glycoprotein; growth factor; macrophage; monomer; T-cell
F;1-17/Domain: signal sequence #status predicted &SIG>
F;18-144/Product: granulocyte-macrophage colony-stimulating factor #status predicted
F;44/Binding site: carbohydrate (Asn) (covalent) #status predicted

granulocyte-macrophage colony-stimulating factor precursor - sheep
C;Species: Ovis orientalis aries, Ovis ammon aries (domestic sheep)
C;Accession: A61632
R;O'Brien, P.M.; Rothel, J.S.; Seow, H.F.; Wood, P.R.
Immunol. Cell Biol. 69, 51-55, 1991
A;Fitle: Cloning and sequencing of the cDNA for ovine granulocyte-macrophage colony-stimm. A;Fitle: Cloning and sequencing of the cDNA for ovine granulocyte-macrophage colony-stimm. A;Status: preliminary, not compared with conceptual translation
A;Molecule type: mRNA
A;Residues: 1-144 <OABs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cipate: 31-Mar-1989 #Sequence_revision 31-Mar-1989 #text_change 09-Jul-2004

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PHARMACEUTICAL: Available under the names Leukine (Immunex) and Leucomax (Novartis). Used in myeloid reconstitution following bone marrow transplant engrathement failure or delay, mobilization and following transplantation of autologous peripheral blood progenitor cells, and following induction of eneotherapy in older adults with acute myelogenous leukemia. SIMILARITY: Belongs to the GM-CSF family.

and Fusion proteins comprising a human interleukin-3 variant, a linker e interleukin-3, a variant or a colony stimulating factor - useful to increase haematopoietic cell prodn. in a mammal.

Claim 16; Page 86; 447pp; English

A new fusion protein has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, in which R1 is a mutant or variant of human interleukin-3 (h1L-3) having the present generic sequence. R2 is a second colony stimulating factor (GSP) including cytokine, lymphokine, interleukin, haematopoietic growth factor or IL-3 variant, and L is a linker. The present sequence corresponds to all-3 variant, and L is a linker. The present sequence corresponds to Learnich H1L-3(1-133) in which 1-14 amino acids may be deleted from the N-terminal, 1-15 amino acids can be deleted from the N-terminal, 1-15 amino acids in the region 17-123 are different from those in the native protein. The fusion protein is used to increase haematopoietic cell production. It is also useful as an IL-3 antagonist or as a discrete antigenic fragment for

```
Antagonists are used to block the growth of certain cancer cells and intreatment of asthma. The fusion protein can also be used to stimulate bone marrow and blood cell activation and growth in vitro before infusion erythroid, lymphoid and/or megakaryocyte cells of the haematopoietic system. The protein has the usual activity of both its component undesired side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              126 SGGSNWAPARSPSPSTQPWEHVNAIQEARRLINLSRDTAAEMNETVEVISEMFDLQEPT 185

stimulating factors (CSPS) (e.g. cytokines, lymphokines, interleukin.

catalor haematopoletic colony stimulating factors) or other interleukin.

cardor haematopoletic colony stimulating factors) or other interleukin.

cardor haematopoletic colony stimulating factors or other interleukin.

cardor haematopoletic disorders resulting from bacterial, viral and fungal infections, cancer radiation therapy, chemotherapy or bone marrow suppressive drugs. They may also be used in vitro to stimulate bone marrow and blood call activation and growth prior to infusion of the bone marrow and blood transplants into patients. IL-3 is a haematopoietic marrow and blood transplants into patients. IL-3 is a haematopoietic colls. The fusion coll constituent peptides and further by having a biological or by physiological activity greater than the additive function of the IL-3 or second CSF alone (1.e. the peptides act synergistically). Their activity may also be further enhanced by the mutations they comprise. The variations may further reduce undesirable side effects associated with IL car and AAAA3722 to AAAA03782 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        185

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 8
                                                                                                                                                                                                                                                                                      The invention relates to chemically modified myelopoietin (MPO) conjugates having at least one water-soluble polymer molecule covalently attactivating group, to at least one amino acid residue of a biologically active myelopoietin polypeptide. MPOS are multifunctional agonists of human interleukin-3 (IL-3) and another haematopoietic growth factor receptor. Sequences of the invention are useful for treating haematopoietic disorders (e.g. neutropenia, leukopenia, thrombocytopenia and anaemia), including those arising from chemotherapy and radiation therapy. MPOs are also useful in bone marrow transplantation, wound healing, burn treatment and the treatment of parasite, bacterial or viral infection. They are useful for mobilising haematopoietic progenitors and stem cells. The chemically modified MPOS have a longer lasting neutrophil stem cells. The chemically modified MPOS have a longer lasting neutrophil decreased antigenicity than unmodified myelopoietins. The present

The invention relates to ex vivo expansion of stem cells, comprises culturing stem cells with a growth medium comprising a chimaera protein, and harvesting the cultured stem cells. The chimaera is based on a mutated human interleukin-3 (IL 3) sequence coupled to a haematopoietic factor (e.g. GM-CSF (colony stimulating factor), CSF-1, G-CSF, G-CSFS-17, c-mpl ligand TPO, MGDF, erythropoietin, IL-1-13, IL-15, IL-16, IL 3 ligand, human growth hormone, B-cell growth factor, B-cell differentiation factor, eosinophil differentiation factor and stem cell factor (SCF) via a peptide linker. The formula for the chimaera is given in the specification. Also included is a method for enhancing the in the specification. Also included is a method for enhancing the chimaera is given in the specification of cultured stem cells by a heterologous gene, comprising; (a) removing stem cells from a patient or donor; (b) culturing the stem cells with a growth medium comprising the transduced cells; and (d) harvesting the transduced cells; and (d) harvesting the transduced cells; and centaring the efficiency of the transduction of cultured stem cells by a heterologous gene. The method is also useful for treating a patient cells are also useful in the treatment of cyclic neutropenia, aplaetic anaemia, thrombocytopenia, idiopathic entropenia, chediak-Higdshi synforme, thrombocytopenia, idiopathic entropenia, chediak-Higdshi synforme,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  185

A fusion protein (AAM19763) comprises human p53 tumour suppressor protein and granulocyte-macrophage colony stimulating factor (GM- CSF). It is the expression product of a nucleic acid molecule (AAT72724) prepd. by PCR amplification of p53 cDNA GM-GSF DNA sequences (the GM-CSF antisense primer including a hexahistidine tag sequence) and their fusion via a AbaI linker. Fusion expression vectors can be used to transfect mammalian and insect cells. The p53-GM-GSF fusion protein is used to generate anti-p53 immunity. Tumour cells are eliminated by cytotoxic T lymphocytes activated in vivo or in vitro by exposure to antigen- presenting cells exposed to the fusion protein

                                                                                                                                   ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method whereby stem cells are ex vivo expanded via culturing the stem cells with a growth medium comprising a chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antianaemic, immunostimulant, immunosuppressive, cytostatic and neuroprotective applications and may be useful to target haemopoietic cells for gene therapy, preferably for treating patients having a haemopoietic disorder characterised by decreased levels of having a haemopoietic disorder characterised by decreased levels of having a haemopoietic and/or megakarycyte cells of haemopoietic system. The expanded ex vivo cells may be used to treat neutropenia, aplastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, aplastic anaemia, periodic neutropenia, myelodishersis syndrome or myelofibrosis. The current sequence is that of a chimera protein related to the human interleukin-3 (IL-3) mutant protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic human granulocyte colony stimulating factor (GM-CSF), see corresp. AAN90274. Its DNA has useful restriction sites for: HindIII; BspMi; NcoI; BstEII; BsmI; EcoRV; BgII; ApaI; Ball; XmnI; BamHI; and EcoRI. Used to facilitate cassette mutagenesis of selected regions. Synthesised by phosphoramidite chemistry, by dividing desired gene into 18 oligomers. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 MAPARSPSPSTQPWEHVNAIQEARRLINLSRDTAAEMNETVEVISEMFDLQEPTCLQTRL

A new fusion protein is disclosed which has the formula R1-L-R2, R2-L-R1, CR1-R2, R2-R1, R1-L-R1 or R1-R1, where R1 is a mutant or variant of human interleukin-3 (hIL-3), R2 is a second colony stimulating factor (CSF) including cytokine, 1ymphokine, interleukin, haematopoietic growth factor or IL-3 variant, and L is a linker. Generic sequences are described in AAW03235 - AAW03242, and specifically claimed examples are shown in CC AAR793428 R79335 and AAR79342-T79345. The fusion protein is made by recombinant DNA techniques. Specifically claimed examples of DNA cequences which encode these proteins are shown in AAQ97167-Q97204 and AAQ9722-C99727. The fusion protein is used to increase haemactopoietic cell production. It is also useful as an IL-3 antagonist or as a discrete antigenic fragment for production of antibodies useful in immunoassays and immunotherapy. Antagonists are used to block the growth of certain can end immunotherapy. Antagonist are used to block the growth of certain can end in immunoassay of the object of myeloid, erythroid, lymphoid and/or megakarycyce cells of myeloid, erythroid, lymphoid and/or megakarycycyce cells of the haematopoietic system. The protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 75 BLYKQGLRGSLTKLKGPLTMMASHYKQHCPPTPETSCATQIITFESFKENLKDFLLVIPF 134

A series of oligonucleotides were synthesised and ligated together to form a stable expression construct. The technique is used for the efficient prodm. of a glycoprotein with hGM-CSF activity. Methods have been developed for treating haematopoietic disorders with fusion proteins comprising recombinant, mutated human interleukin-3 (HIL-3) variants or mutant proteins (muteins) fused with secondary colony stimulating fused with secondary colony stimulating fused with secondary colony stimulating factors) or other interleukin-3 and/or haematopoietic colony stimulating from bacterial, viral and fungal creat hematopoietic disorders resulting from bacterial, viral and fungal infections, cancer radiation therapy, chemotherapy or bone marrow and blood cell activation and growth parior to stimulate bone marrow and blood cell activation and growth prior to infusion of the bone marrow and blood transplants into patients. IL-3 is a haematopoietic growth factor which has the property of being able to promote the marrow and blood transplants into patients. IL-3 is a haematopoietic growth factor which has the property of being able to promote the molecules are characterised by possessing the usual activity of both of their constituent peptides and further by having a biological or physiological activity greater than the additive function of the IL-3 or physiological activity greater than the additive function of the IL-3 or second CSF alone (i.e. the peptides act synergistically). Their activity may also be further reduce undesirable side effects associated with IL-3 AAYS3130 to AAYS3121 to AAAO3721 represent sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating hematopoietic disorders with fusion proteins comprising mutated interleukin-3 fused with secondary colony stimulating factors or other interleukin-3 variants.
                                                                                                                                                                                                                                                                                                                                                                          Klein BK

conjugates having at least one water soluble polymer molecule covalently attached, via activating group, to at least one amino acid residue of a biologically active myelopoietin polypetide. MPOs are multifunctional agonists of human interleukin-3 (IL-3) and another haematopoietic growth factor receptor. Sequences of the invention are useful for treating haematopoietic disorders (e.g. neutropenia, leukopenia, thrombocytopenia and anaemia), including those arising from chemotherapy and radiation therapy. MPOs are also useful in bone marrow transplantation, wound healing, burn treatment and the treatment of parasite, bacterial or viral infection. They are useful for mobilising haematopoietic progenitors and stem cells. The chemically modified MPOs have a longer lasting neutrophilitelessing activity, decreased clearance rate, increased stability and decreased antigenicity than unmodified myelopoietins. The present sequence is a chemically modified myelopoietins. The present
                                                                                                               Myelopoietin conjugate, MPO, immunosuppressive, vulnerary, antiparasitic, antibacterial, virucide, interleukin-3; IL-3; haematopoietic disorder, haematopoietic growth factor receptor; neutropenia, thrombocytopenia, leukopenia, anaemia, chemotherapy, bone marrow transplantation; burn; radiation therapy, haematopoietic progenitor mobilisation; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         75 ELYKOGLRGSLIKLKGPLIMMASHYKQHCPPTPBTSCATQIITPESFKENLKDFLLVIPF 134

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  KLEI/)
THE STATE OF THE S
```

```
The invention relates to a novel method whereby stem cells are ex vivo expanded via culturing the stem cells with a growth medium comprising a chimera protein, followed by harvesting of the cultured stem cells. The method of the invention has antiansemic, immunostimulant, immunosuppressive, cytostatic and neuroprotective applications and may be useful to target haemopoietic cells for gene therapy, preferably for treating patients having a haemopoietic disorder characterised by decreased levels of maving a haemopoietic disorder characterised by decreased levels of paving a haemopoietic disorder characterised by decreased levels of system. The expanded ex vivo cells may be used to treat neutropenia, aplastic anaemia, periodic neutropenia, Chediak-Higashi syndrome, aplastic anaemia, periodic neutropenia, myelodysplastic syndrome or myelofibrosis. The current sequence is that of a protein related to the human interleukin-3 (IL-3) mutant protein of the invention.
                                           Ex vivo expansion of stem cells, e.g. hematopoietic cells for treating aplastic anemia, involves culturing the stem cells with growth medium comprising chimera protein, and harvesting the cultured stem cells.
                                                                                                                                            Disclosure; SEQ ID NO 160; 202pp; English.

```
An ew fusion protein has the formula R1-L-R2, R2-L-R1, R1-R2, R2-R1, R1-L-R1 or R1-R1, in which R1 is a mutant or variant of human interleukin-3 (MIL-3) having the present generic sequence, R2 is a second colony stimulating factor (CSF) including cytokine, lymphokine, interleukin, heamatopoietic growth factor or IL-3 variant, and L is a linker. The present sequence corresponds to native hIL-3(1-133) in which 1-14 amino caids cam be deleted from the N-terminal, 1-15 amino acids can be deleted from the N-terminal, 1-15 amino acids can be deleted from the N-terminal, 1-15 amino acids in the region 17-123 are different from those in the native protein. The fusion protein is used to increase heamatopoietic cell production. It is also usedul as an IL-3 antagonist or as a discrete antigenic fragment for production of antibodies useful in immunoassays and immunotherapy.

CC Antagonists are used to block the growth of certain cancer cells and in treatment of asthma. The fusion protein can also be used to stimulate con marrow and blood cell activation and growth in vitro before infusion in the protein has the used synergistic activity and reduced system. The protein has the usual activity of both its component proteins, but may have increased synergistic activity and reduced undesired side effects
Fusion proteins comprising a human interleukin-3 variant, a linker a interleukin-3, a variant or a colony stimulating factor - useful to increase haematopoietic cell prodn. in a mammal.
                                                                                                                       Claim 16; Page 87-88; 447pp; English
